

A nationwide network of change makers, thought leaders and innovators.

We are the Life Course Translational Research Network.

Translating research into action.

The Life Course Translational Research Network (LCT-RN) works to optimize life course health trajectories for children and families by integrating—rather than merely aggregating—the knowledge, skills, tools, and expertise practitioners, patients, family members, community residents, researchers, and other stakeholders and participants can provide.

The Network's 7 research nodes and 3 research cores are comprised of 125+ researchers from 40+ institutions from across the nation. These nodes partner with communities to co-design, test, implement, spread, and scale effective interventions that can improve life course health trajectories of children and families.

Want to partner with us?

We are looking for new partnerships with cities, counties, community groups, and others who want to innovate with us and be an early adopter of emerging interventions.

For more information, visit us online at healthychild.ucla.edu/lct-rn.

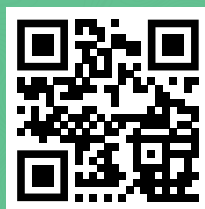

About the Network

The Life Course Translational Research Network (formerly the Life Course Intervention Research Network) aims to bridge the gap between scientific knowledge and population health impact by applying new knowledge from life course research to long-standing public health problems through new types of partnership with families, communities, and other stakeholders.
